## How use column (autoincrement)

How use column (autoincrement)?

The screenshot shows the DBeaver interface with two main panes. On the left is the SQL Editor containing the following class definition:

```

Class samples.Account Extends %Persistent [ SqlTableName = sys_account ]
{
    // How Auto-Increment?
    Property id As %BigInt; ← Red arrow points here
    Property age As %SmallInt;
    Property name As %String [ Required ];
    // Index to id
    Index indexToId On id [ Unique ];
}

```

On the right is the Database Navigator pane, which displays the sys\_account table. The table has four columns: ID, age, id, and name. The first row has values 1, 65, [NULL], and testPerson. The second row has values 2, 50, [NULL], and testPerson2. A red box highlights the first row's ID column, and another red box highlights the second row's ID column. A red arrow points from the question "What is ID1?" to the first row's ID cell. Another red arrow points from the question "How Auto-Increment?" to the second row's ID cell.

ID	age	id	name
1	65	[NULL]	testPerson
2	50	[NULL]	testPerson2
