Extracting last value in a repeating field

Hi,

I have a PV1 repeating field that can contain multiple or a single value. I'd like to always pull the last value in the field but am not sure how to configure this in my DTL.

The repeating field is in PV1:50().1

Could somebody shed some light on this?

Examples:

¦15081942¦5081951¦5108961¦5280550¦

¦15081947¦

¦15081939¦5081940¦

Thanks
