## Return Clone of message

Hi everyone, I am trying to return a cloned version of my ADT that I have made changes to in a Business Process. So far I have the following in my process.

```
&sql(Select MemberId INTO :pMemberIDval from CDSMMemberAPI .MemberInfo where MemDOB = :ptDOB and MemLname = :ptLname and MemFname = :ptFname)
```

```
set newrequest = pRequest.%ConstructClone()
```

```
set MemberIDPID4 = newrequest.SetValueAt(pMemberIDval, "PID:4.1")
```

The following does return the value I am populating the clone with to the log

```
set newrequestPID4 = newrequest.GetValueAt("PID:4.1")  
$$$LOGINFO("newrequestPID4DB " _newrequestPID4)
```

So then I try to set the old request with the new but, I get nothing sent back out the trace. Any Ideas where I am going wrong

```
set pRequest = newrequest
```

```
return newrequest
```
