## Can OAuth2 be used in a mirrored environment and what is the best practice?

Hi,

We are currently looking at a way of securing any future REST API's using OAuth2, where the Authorisation Server (OAuth2) and Resource Server would be on the same server.

However, as we have mirrored environment the Resource Server, and therefore the Authorisation Server, need work with a Virtual IP Address and be able to failover to either of the mirror member servers.

Is that possible with OAuth2 and if so what are the best practices for this?

Any advice or guidance much appreciated.

Thank you.
