IAM 1.5.0.9 is now GA (Generally Available)

The GA release is now published for the 1.5 version of the InterSystems API Manager (IAM).

The container for IAM, including all relevant artifacts to upgrade from earlier versions of IAM can be downloaded from the [WRC Software Distribution site](#) in the Components area.

The build number for this release is IAM 1.5.0.9-4.

InterSystems API Manager 1.5 makes it easier to manage your API traffic, integrate with your environment and onboard users of your APIs. It has many new capabilities, including:

- Improved User Experience
- Introducing new Developer Portal tools
- Support for Kafka connectivity

This release is based on Kong Enterprise version 1.5.0.9. Previous IAM releases included a white-label version of Kong Enterprise, and with this release we include Kong Enterprise without white-labelling it. This change allows us to bring new releases to you in a much more frequent cadence and leverage the documentation and other assets that Kong provides more effectively.

Documentation for IAM 1.5 can be found [here](#). This documentation only covers elements that are specific to IAM. Documentation links within the product bring users directly to the documentation from Kong Enterprise.

Upgrading from IAM 0.34-1 requires incremental upgrades through three intermediary releases, which is described in further details in the [documentation](#).

IAM is only available in OCI (Open Container Initiative) a.k.a. Docker container format. Container images

are available for OCI compliant run-time engines for Linux x86-64 and Linux ARM64, as detailed in the [Supported Platforms document](#).

Best Regards,

Stefan
