## Can I get currently running Jobs on a particular business host and hold them in a variable

I am working on automating to pick all the jobs running particular business process and kill them by using a routine. Though I was able to kill the jobs/PID on server by using (sudo kill jobid) and by using `do $SYSTEM.Process.Terminate(jobid)` or `Do ##class(Ens.Job).UnRegister("business host", jobid)`, I am looking to build a routine by setting a variable with all the business process names and then fetch the jobid or PID associated with those business process and kill them. Any help is highly appreciated.
