Deploying Packages Without Source Code - commercial mode. Do we need it?

Hi Developers!

Thank you for using ZPM Package Manager and contributing more and more useful packages to the [public registry](#)!

But as you already aware ZPM packages are always deployed with source code.

Do you think we need to add the option to deploy without source code - e.g. if you want to deploy a commercial package?

Will you develop commercial modules if there will be an option and deploy it with ZPM?

How do you deploy commercial applications today?
