## How to sync info not in Mirror?

IRIS use MIRROR to ensure the continuous operation of the hospital business, but MIRROR synchronization data does not contain (web application configuration information, task plans, sql gateway, etc.), about the synchronization of such information do we have a better solution to solve this problem? For example, if we want to make cross-server backups of key information such as code (which can be used as business recovery), if the cluster servers cannot recover and provide services in an unexpected situation but we need to resume production business with such backup information to quickly resume business, is there a good solution for this type of scenario?
