Problem with docker-compose

Environment:

- Windows 10
- Docker Desktop version v20.10.5

Since last update of Docker Desktop (~2 weeks) I get this error message running `docker-compose build`

`C:\GitHub\zme>docker-compose build`

Building iris

failed to get console mode for stdout: The handle is invalid.

The protocol of build is somehow scrambled and not so useful.

Searching up & down the web I finally found a simple workaround to solve the problem.

`C:\GitHub\zme>set COMPOSEDockerCLIBUILD=0`

Now the protocol is the same as I used to have and you can follow it with no problems
