## Do I need to enable LDAP authentication for my Cache instance ot use LDAP auntentication in a single CPS application?

Currently, I am working on a CSP application that is supposed to generate reports. Users will have varying access to said reports. To achieve that, I plan to use LDAP (because it's used in other systems where those users already exist). Documentation does not provide enough information, so I'd like a clarification:

Do I need to enable LDAP authentication for the whole Cache instance to use LDAP authentication in a single CSP application in that instance?

We (as in me and my organization) use Cache Authentication for our instances, and one of the reasons to use LDAP for this system was to avoid mixing employees of our organization and our users.

[#Authentication](#) [#Access control](#) [#CSP](#) [#LDAP](#) [#Caché](#)

Product version: Caché 2018.1
