## Access deepsee dashboard via delegated access

Dear Folks,

I have recently studied deepsee and developed few dashboards needed for our web app users. I am trying to embed them in our existing web app which uses angular with delegated user access. I need to embed the native IRIS dashboard into it. ( I can't use Highcharts or any other js tools).

How do I setup the dashboards to work with delegated authentication (Without providing access to management portal or other parts) ? Also should I use the default `csp/{Namespace}/DeepSee.UserPortal.DashboardViewer.zen?` or any other web application URL ?

Thanks
