Parsing Object Script arrays in Python

Is there a way to automatically transform Object Script arrays to Python lists? This code results in a list of arrays

```
Iter0 =  dbnative.iterator("HS.Data.OIDMapD")
for subscript, value in Iter0.items():
    print(f"subscript={subscript}, value={value}")
```

Here is the result:

```
subscript=1, value=2.16.840.1.113883.3.86ISCInterSystems Corporation
```

I suppose it would be too hard to parse this into a list, I was just wondering if there was a function provided to make it convenient and proper.

Thanks,

Marlin Mixon
