EnsLib.Workflow.TaskRequest with complex object

Hi,

we have a EnsLib.Workflow.TaskRequest wich is been send to an operation. The Task request contains a simple object, for that we´ve extendd EnsLib.Workflow.TaskRequest and added the object as an aditional property. The request is successfully created. But how to access the contents of this object from within the user portal when showing the task.

Our TaskRequest contains an object named Patient with some properties. We´d like to display the contents in the tasks description area. WE´ve created an additional template but have a hard time to access the values of the patient object. Is there any special variable to use here?

best regards,
sebastian
