Incoming http messages setup

I need some help. I have a requirement where HL7 messages will be sent through http. I am trying to read through the documentation & want some guidance.

The client is asking for a URL. So should I simply send the Ensemble url to them? Does the message structure change? How does Ensemble handle incoming http messages? Do I just create a http business service and it should come across fine?

Has anyone done a project with http? Would love some information on how it worked for you
