Variable <Undefined> using Xecute command

Hello everyone,

I have a question, I am trying to use xecute command, but something wrong happen when i was using the command, and i don't know why hahahaha.

I created a file .mac with this code:

```
label(test) public{
      set routine="variable"
      set call="write routine,!"
      xecute call
      quit
}
```

But when i run the command, show me this message error:

```
<UNDEFINED>label+3^tstFJR3 *routine
```

After that i changed the code to:

```
label(test)
     set routine="variable"
     set call="write routine,!"
     xecute call
     quit
```

This solved the problem to me, and writed this content:

```
variable
```

Someone can explain to me, why this happend?
