Avoid display of certain properties in message contents display

Hi,

is it possible to avoid the display of certain properties in a custom message class in the message viewer content section. The message class is a common `Ens.Request` with a bunch of properties alongside one property of Type `enslib.dicom.document` which in Turn is Not extended By `%XML.Adaptor` so the content display of course displays an error.

My idea is to avoid the display of That certain property When output is rendered (Text/XML). Using `Ens.Util.MessageBodyMethods` and method `%OnShowContents` could be a way to do this But i don't find a way to do so.

Of course the property containing the dicom document could be set to private but since this in contrast with my application design i am looking for another way to accomplish my goal.

any suggestions are highly welcome.

best Regards Sebastian
