Convert base64 encoded stream into TIF file

Hi All,

I have a requirement where I have to create a TIF file from base64 encoded string comes in HL7 message.

I am reading content and writing to `%Stream.FileBinary` after decoding and using `..Adapter.PutStream (EnsLib.File.OutboundAdapter)` to create a file at operation. the file is getting created but its corrupted.

IS this even possible in cache? what is the correct way of doing this?
