First Script Accessing Trackcare Code Table Element

Dear Experts,

I have to pull out a report of certain code tables and this is my first script and I need to write many.

1. If I have to refer to the table, seeing the reference in the components with reference to SQL table and column,

can I use Select < What I need from the table>

Inner join with reference table?

I tried, I used the code table reference in the components, but I am getting errors,

Code Table		
	Loc	I
	Type	

code	CT loc.edit
Loc	Location Id
Hopital	Description

n	C: Cardiology
	p: Pathology

I tried this

SELECT

CTabc.Type as "Hospital Type", CTabc.Loc as " Location Type"

From (CTabc

INNER JOIN Loc ON CTloc.edit loc = CTabc.loc);

But no matter how I try, I am getting errors then, I have seen some developed tables, could not relate to the tables and table parameters.

How can I use select where table.parameter = x AND table.parameter = Y etc

Please can you help me point to relevant material which can explain how these code tables are designed, relationship between them and how to access each element or update them.
