Example of ChunkedWriter

I'm thinking to try ChunkedWriter based on the documentation I'm reading to solve an issue but could use some clarification. Anyone that could provide a usage example of this down below?

To send a chunked request, do the following:

1. Create a subclass of [%Net.ChunkedWriter](#)

[Opens in a new window](#), which is an abstract stream class that defines an interface for writing data in chunks. In this subclass, implement the `OutputStream()` method.

2. In your instance of [%Net.HttpRequest](#)

[Opens in a new window](#), create an instance of your [%Net.ChunkedWriter](#)

- [Opens in a new window](#) subclass and populate it with the request data that you want to send.
3. Set the EntityBody property of your [%Net.HttpRequest](#)

[Opens in a new window](#) instance equal to this instance of [%Net.ChunkedWriter](#)

[Opens in a new window](#). When you send the HTTP request (see "[Sending the HTTP Request](#)"), it calls the `OutputStream()` method of the `EntityBody` property.
