SQL Trackcare, accessing linked table data

Hi Experts

I am trying to pull the code tables Information and this code table has linked code table not exactly obviously joined by SQL tables or columns. This is confusing me. Please can you clarify how to link these two tables.

I will be generic to ensure, any privacy is protected

CTHospital has CTStaff linked in.

When CTHospital has data, for that relevant hospital code, CTStaff can be clicked and data entered.

When I see in the Components - > Items I do not see any SQL table or SQL column common between CTHospital and CTStaff.

Question: How can I join CTHospital with CTStaff. The layout and component of CTStaff as Parent reference with websys.parent but not as SQL table / Column.

Your help would be appreciated and Please kindly request you to write in detail as I new to the system.
