GitHub has a new feature - VS Code in the cloud

Open up a random ObjectScript project (I think you need to be logged in first for this to work).

[For example, the ZPM project](#)

Then press "." (press full stop).

This will open the git repo inside an online instance of VS code.

Perhaps not that exciting for some, but I was impressed. Mainly because it's a good demo of editing ObjectScript in the cloud. As much as I like VS code locally, I still can't use it on many sites, and maybe not popular, but I still think IRIS + its own web IDE would be a killer combination.

Looks like extensions in the marketplace are limited to core / common extensions at the moment, so no syntax highlighting yet.
