How convert a String to HTML Entity Codes?

Good morning everybody,

In Html sometimes we need to use entities code for don't have problems with browsers all over the world. Ex. 'á' is converted to code: 'á' / 'é' is converted to 'é'.

I have a question, how can i convert a string like my name to this type of code? Ex. "Flávio" will be "Flávio". I tried this way:

```
USER>write $zconvert("Flávio","I","HTML")
Flávio
```

but don't worked :(

Best Regards.
