## Save AccessToken OAuth2

I'm trying to save a list of AccessTokens a user for a specific user. This way I could present it together with other user-data.

I have tried calling `##class(OAuth2.Server.AccessToken).OpenByCode(authCode)` from `%OAuth2.Server.Authenticate's AfterAuthenticate()` method. This only returns things like State and AuthorizationCode, but the AccessToken is empty at this point (afterwards it becomes filled out).

Is there a way to achieve storing the AccessToken as part of the login system?
