How to create a file from a stream - save it - change his name and resave it

Hi gentlemen,

It may be very easy but I'm currently battling with a stupid business operation.

Here is what I must do and what is already in place:

A business service scan every 5 sec the apparition of files and send it to a business process.

The business process (a routeur) don't let pass everything and a few of them go to a specific operation.

The operation must:

1) create the file with the same name of the original one (in the service) then save it

2) change the original and resave it a second time (replacing the previous one but without using the function rename)

Hope you can help me.

The base of my code must be a stream:

Method OnMessage(pRequest As Ens.StreamContainer, Output pResponse As %Persistent) As %Status
{
}

Thanks
