Starting a new job with "job" command take more time than expected

I use the following code to start a start a job :

```
Class MyClass Extends (...)  
{  
    ClassMethod Foo()  
    {  
        job $CLASSMETHOD("MyClass","MyMethod") //take forever depending hardware  
    }  
  
    ClassMethod MyMethod()  
    {  
        //do database related stuff  
    }  
}
```

On local environment, calling Foo() is instantaneous (a few ms). On production/test servers (which have much better hardware than local) calling this function is slow and take between 200 ms to 800 ms. Obviously starting a new job with "job" command take lot of time on those environments.

I don't know the reason of this. Is this a well know issue ?
