Localize Text in an XData Block

Hi everyone!

I am trying to localize text in an XData block using the \$\$\$Text macro. A snippet of code is included below. Is there an easy way to localize the text included in an XData block? So far, using the \$\$\$Text macro is not working; when I export the %MessageDictionary, the text to be localized isn't included in the export.

```
XData LocalizedEmail [ MimeType = text/html ]
```

```
{  
<body>
```

```
<p>
```

```
Text to be translated into another language
```

```
</p>
```

```
</body>
```

```
}
```

Thank you in advance!
