Making a JWT/OAuth2.0

Hello all,

First time post and newer to Cache/ObjectScript in general, please keep it in mind!

Some background: I need to build part of a production whose goal is to send patients emails based on appointment status as a daemon-based approach. I have to use Microsoft Graph to accomplish this, which you need an access token to use. To get the access token, I have to go through the [OAuth2.0 client credentials grant flow](#), which involves the creation of a signed JWT assertion using the RS256 algorithm.

I was looking at the [%OAuth2.JWT](#) class to accomplish this, via its `ObjectToJWT()` method. My question is in order to use this class does my production have to be set up as an OAuth2.0 client? I've seen some [relevant docs](#) into setting that up but am not sure if I necessarily have to configure the production as an OAuth2.0 client just because it's getting an access token. Any other ways to create a JWT would also be appreciated.

Thank you!
