Summit Sessions - Git/GitLab and Package Manager Advanced Topics

I'd like to bring your attention to my two Virtual Summit sessions, even though they're not HALF as cool as [Embedded Python](#).

[Git & GitLab for Shared Development Environments](#) details the newly-released [git-source-control](#) package (see also on the Open Exchange) which provides a new best-of-breed solution for server-side IRIS/Git integration, especially for shared remote development environments. (I need to write up a post about this package specifically and plan to do so soon.)

[InterSystems Package Manager Advanced Topics](#) shows that our package manager (affectionately referred to as "ZPM") is more than just a tool for grabbing useful packages from the community - it can in fact drive the build, packaging, and distribution of full solutions.

I'm happy to answer any questions here or via message/email!
