intersystems python client

Hello,

We are connecting to our client's Intersys database with python3.8 on our Ubuntu 20.04.2 LTS, we are having trouble getting the intersys.pythonbind module to work.

We are able to install the intersystemsirispython-3.2.0-py3-none-any.whl but, when we try to run the code we always get:

Traceback (most recent call last):

File "./getwelllife.py", line 4, in <module>

```
import intersys.pythonbind
```

ModuleNotFoundError: No module named 'intersys'

Please could you tell us what may be going wrong?

Please also feel free to ask for any additional information.

Thanks and regards!
