## How to access SSLConfiguration from Adapter settings in BusinessOperation

Hi All,

I have configured Business Operation with EnsLib.HTTP.OutboundAdapter and set properties.

In the BusinessOperation method I am trying to create %Net.HttpRequest

```
Set httpRequest= ##class(%Net.HttpRequest).%New()
```

to post REST Service.

I am able to access HTTPServer ,URL details form Adapter using below code

```
Set httpRequest.Server = ..Adapter.HTTPServer  
Set httpRequest.Location = ..Adapter.URL
```

How to read SSLConfiguration from Adapter properties?

As of now , I am hardcoding same string which I have configured for BusinessOperation Settings tab

```
Set httpRequest.SSLConfiguration = "ISC.FeatureTracker.SSL.Config"
```

Could you please tell me how to avoid this hardcoding code?
