VS Code ObjectScript and Language Server extensions now leverage the enhanced credential security of Server Manager 3

In my [previous post](#) I described how to install the pre-release of the Server Manager 3 extension and benefit from enhanced security for your stored credentials.

Now by upgrading to the latest release (1.2.7) of the [InterSystems Language Server](#) and opting in to the 1.3 pre-release of the [ObjectScript](#) extension you get the additional reassurance of being notified whenever either of those extensions try to access stored credentials for the first time.

[#Security](#) [#VSCode](#)
