Globals documentation

I have a client with cache instance that is growing by 10-30G/day. In order to determine what is consuming space I ran "DO ^%GSIZE" to generate a report. From the report the bulk of the space consumption is from a couple of globals which appear to be built in globals not user defined. I would like to find documentation that details the function of these globals to help me understand how and why space is being consumed at such a rapid pace. The two globals of immediate concern are STRELPERF and STSRCHAUDIT but If there is reference where globals are defined that would be a useful tool going forward.
