Question about setting up Apache HTTP and Web Gateway to use TLS

I am not sure if this is the correct place for this question, but I am struggling to setup TLS security for our IRIS Management Portal and etc. through Apache and the Web Gateway. I have a couple of questions when it comes to the setup.

- if I build a private key and certificate within Red Hat, does that certificate have to be on everyone's pc to connect to the Management Portal?
- Can I use a self signed Certificate?
- Can I use the existing CA on the server, or do I need to work with my Data Security team to get a Certificate?

Any help would be appreciated

Thanks

Scott Roth
