Python script to perform $ZDATE function

I have a python script that is pulling the cache instance key expiration date (KeyExpirationDate()) which comes back as an integer. With the queryscript function - $ZDATE(73284) I can derive the actual expiration date. Is there a manner or method of creating an equivalent Python script that will convert the integer return by the KeyExpirationDate() method into a date string?

#Python #Caché
