HL7 in general business rules

I'm trying to create a general business rule, not an HL7 message router. (This is because i want to return values from the rules and message routing rules don't appear to be able to return values.) But, I want the business rules to be able to look at HL7 messages; I've copied a simple when condition from an HL7 message router but the error log throws up <PROPERTY DOES NOT EXIST> *HL7

I'm guessing that because it's a general business rule the 'HL7.' syntatic shortcuts aren't available. Is there a way to switch these shortcuts on in a general business rule? I've tried setting the context class to EnsLib.HL7.MsgRouter.RoutingEngine, no luck.

Thanks
