Need help converting from objectscript query into Python query

I have the object query:

```
s Rset=##class(%ResultSet).%New("%SYSTEM.License.UserListAll")
```

I can loop through that query and it generates the report information that I need.

I have a Python process where I use the intersys import to connect to the Cache instance. But I have been unable to determine the correct syntax in Python for this query. Being that 'UserListAll' is a query I attempted to user:

```
res = <query>.prepare("select * from %SYSTEM.LicenseUserListAll")
```

That failed stating 'UserListAll' did not exist. Though this did not seem to be correct, I also attempted:

```
<query>.prepareclass("%SYSTEM.License", "UserListAll")
```
