Purpose of Mirror Monitor Launch Task

Hi:
The task Mirror Monitor Launch Task recently failed and is placed in Suspend leave. Although it says USER it is not known as a task for us.

The code runs is HSSYS which is not our main system or namespace for production items.

The task name is HS.Util.Mirror.Task runs

If `$system.Mirror.IsMember()` Do `##class(HS.Util.MirrorMonitorAgent).StartAgent()` and just says the description

`/// This is the task definition that Launches the mirror monitor on any mirrored instance`

I don't understand why this task runs or what it does. I assume it has just suspended as the `startAgent()` failed.

We are able to load up Mirror monitor GUI fine and mirroring is completely ok so based on the docs on <https://docs.intersystems.com/irisforhealthlatest/csp/documatic/%25CSP.D...> I don't believe there is an issue but don't know why there is such a task or why it might suddenly fail to work

It is set to run on any mirror member.

[#Failover](#) [#Mirroring](#) [#Ensemble](#)

Product version: HealthShare 2017.2

\$ZV: Windows (x86-64) 2017.2.2 (Build 865_0_18321U)
