# How to find out which Class/ClassMethod is causing lock on a specific table?

Hello everybody.

My question originated when trying to help a coworker...

There is a system module, specifically a ClassMethod that inserts records into a table as per the pseudocode below:

```
set Obj = ##class(FooSchema.FooTable).%New()  
set Obj.fooProp = fooValue  
// Other Foo properties //  
set status = Obj.%Save()
```

From time to time, when trying to save the object, an error, informing that it was not possible to obtain the exclusive lock on the table instance

I want, using objectscript, to find out which other part of the system (Classmethod) is causing the lock on this table

Reading the documentation, I found %SYS.LockQuery, but the closest I got was figuring out which owner/pid caused the lock...

Is there any way, through this PID, to extract the information I need? Or, is there another way to solve this issue?

Every help is welcome
