On-Line Class Documentation Formatting Broken

Looks like someone's been messing with the style sheets ...I've tried Edge, Chrome and Firefox and for all the versions I've checked, the class docs are formatted like this:

classmethod **Export**(Nsp As %String = \$namespace, ByRef GlobalList As %String, FileName As %String, OutputFormat As %Integer = 5, RecordFormat As %String = "V", qspec As %String = "d", Translation As %String = "", ByRef Skipped As %String, Header As %String = "") as %Status

ExportsGlobalListfrom a namespace

NsptoFileNameusingOutputFormatandRecordFormat.GlobalListis a comma delimited string or a local array, containing the names of the globals to export. A leading ^ and trailing type of .gbl on each global name are

dropped and a message that it will be skipped is displayed. Use ISM/ObjectScript format to export mapped globals.
