### Question

[Cryze Zhang](#) · Apr 5, 2022

## How to understand the "sets" of this "\$system.OBJ.GetQualifiers" method?

How to understand the "sets" of this "\$system.OBJ.GetQualifiers" method?

The screenshot shows the InterSystems IRIS Class Reference for the %SYSTEM.OBJ class. The left sidebar shows namespaces: %SYS (selected), Hide percent classes, OBJ (selected), OS, Process, and SCL. The main area shows the class details for %SYSTEM.OBJ. A red box highlights the classmethod `GetQualifiers(system As %Boolean = 0) as %String`. The description states: "Get the default qualifiers for this namespace or this system. If system is true then this gets the default qualifiers for this system, otherwise it sets the default qualifiers for this namespace." A red question mark icon is placed next to the word "sets?". The right sidebar shows Class Details with 74 methods, 2 queries, and Inherited Members, and a Hide private members button.

#InterSystems IRIS #InterSystems IRIS for Health

Product version: IRIS 2022.1

\$ZV: IRIS for Windows (x86-64) 2022.1 (Build 133U) Thu Feb 24 2022 01:21:09 EST
