Project zpm-generate-ui (znamespace, package, view, edit) Article 3.

I will devote the third article to a story about the additional features of the project.

znamespace

Very often you need to find out if there is a specific package in the current instance, for example, so as not to duplicate.

To do this, I implemented a modification of the namespace command of the package manager, on the option tab, you need to press the FIND button.

You can filter by package name. You can filter by package name. As a result, we get a list in which namespaces, which versions of packages are.

package

After installing the package, sometimes there is a need to collect all the files into an archive, for this you need to click the package button after specifying the package name and the path on the disk where you want to create the archive.

And if everything is done correctly, then the archive can be downloaded from the file-server tab

You need to click the download button

view

For more information about the resource, you can click on the active link and the modal window will display the source code of the class,

program or global

edit

Globals can be additionally edited.

Or, in the option panel, go to the apptools panel of the viewer,

or the global editor

All additional features of the [apptools-admin project](#) can be found in [articles](#)

If the project was useful to you, then [vote for it](#).
