VSCode - Is there a Tip or Trick to viewing objects in the Variables pane while debugging?

While I love using VSCode for IRIS development work, one of the persistent frustrations with it has been the inability to display an object hierarch in the variables window while debugging. Only the object's reference identifier is displayed. Cache Studio's handling of the same issue is a little clunky, but it does at least have the option to display something as an object.

For now, I make do with a combination of the watch window and the command line in the debugging console -- but this feels just a step away from log.debug()/console.log() level debugging sometimes.

Did I miss a documentation section or a memo? Is there actually a better way to do this and I simply don't know how?

Cordially,

Jonathan
