Using host variables with embedded SQL isn't working for me

Hi

I'm using an embedded SQL statement with a a cursor-based Embedded SQL query that uses host variables in the where clause, however, what I'm doing doesn't seem to work. Can anyone help?

The code I'm using is

```
set tMessageName = "AssessmentsMessage"
set tIdentifier = "SectionCode"
set ID = 0
&sql(
    Declare IDs Cursor For
    select  %ID
    INTO :ID
    from GMECC_DocmanConnect_Tables.ParisConnecMessagetSettings
    Where  MessageName = :tMessageName
    and Identifier = :tIdentifier
)

&sql(Open IDs) For {
   &Sql(fetch IDs) If SQLCODE Quit // SQLCODE = 100, now rows found
       w !, ID
       If $$$ISERR(tSC) Quit
} &Sql(Close IDs)
```

The table being queried contains 9 rows, and with the two parameters provided, it should return only 1 row, and instead returns nothing.

What am I missing?
