COS script for getting users from Security.Users is returning an empty result

I wrote this COS script that I can run in a terminal session to get a view of the cache users:

```
set hdl = ##class(%Library.ResultSet).%New()
set hdl.ClassName = "Security.Users"
set hdl.QueryName = "Detail"
set sc = hdl.Execute()

while hdl.%Next() { do hdl.%Print() }
```

I know this is a bit rudimentary but this seems to be the correct script to get users. But looking at one of the clients AIX based instances there are about 3900 users. But this script returns no results. In fact, after the execute if I issue "w hd.%Next()" it returns 0. I look at "Do DisplayError^%apiOBJ(sc)" and the message is:

ERROR #5660: Query 'Security.Users:Detail' does not exist

which doesn't seem possible. Not sure what I am missing with this script
