VS Code ObjectScript extension release 1.8.0

This month I announce the release of version 1.8.0 of the VS Code extension, which contains the following enhancements and bug fixes.

The big news is support for server-side project files as some of you old-timers will remember from Studio. If you work client-side, VS Code already has great project management features. You can simply use a folder as a project, or use [multi-root workspaces](#). But if you work server-side, you might appreciate some better artifact management capabilities, and that's what this feature is about. Read more in this [new Projects chapter of the documentation](#).

Change Log for 1.8.0

- Enhancements
    - Add support for server-side projects ([#851](#))
    - Implement isfs folder rename and deletion ([#923](#), [#922](#))
    - Support "mapped" flag for isfs and export filters, to exclude packages mapped from other databases ([#931](#))

The full changelog for all releases is [here](#).

As always, if you already have the extension installed, VS Code should automatically update your extension. If you're a new user, [use these instructions](#) to get started.
