IRIS for Heatlh in a Ubuntu Machine

Hi everyone, I'll be honest with you I don't have much idea how to do this, but I was asked to install IRIS for Health on an AWS ubuntu machine(ssh -i "teleker-net pem" [ubuntu@ xx.xxx.xx.xxx](#)(no I will put the real number)). My boss has sent me the .key and .pem files that I am supposed to need for the installation.

I am quite confused with the information that I have found to connect to AWS because it is not that I want to do it from any new, but that I need to connect to a machine that already exists, but I do not think so. I do not know if I explain myself very well. Any help is greatly appreciated.
