Developer Community Release, May 2022

Welcome to the May'22 Community Release!

We ' ve made some enhancements to your experience recently in the InterSystems Community:

- Improved current events tracking

- Scheduled posting

- Enhanced code formatting

- Faster table creation

- Enriched reply experience

- Changed post teaser design

Let's have a closer look at all of these below.

LIVE NOW for Events

To make finding the currently held event easier and more convenient, we've added a new section LIVE NOW at the top right corner of the page.

The screenshot shows the InterSystems Developer Community interface. On the left, there's a sidebar with 'All posts' and a list of categories: InterSystems Official, Announcements, Articles, Questions, and More... Below this is a section for 'InterSystems resources' with a link to 'Download InterSystems IRIS'. The main content area features a post by Mike Johns titled 'How to configure non repository maven files (like intersystems-jdbc-3.1.0.jar)'. The post text explains that some InterSystems Java libraries are not available in public Maven repositories and provides instructions on how to configure the Java Maven dependency. A red arrow points from the 'LIVE NOW' event notification in the right sidebar to the post. The sidebar also shows a 'New post' button and a list of events, including 'InterSystems Developer Community Webinar For Beginners' on May 14 and 'InterSystems IRIS 2022.1' on July 13.

And if you click on it, you will be redirected to the page of the event where you can choose to join it (if it is held online, of course).

To take advantage of this feature, your announcement of the event needs to follow these conditions:

- Create your event as usual [add the Events tag -> special fields will appear automatically]
- Verify that your event has a specific start time and finish time (all-day events aren't featured in this section)
- To let people join your event online directly from this bar add a Direct link to join
- That's it, you're good to go!

The screenshot shows the event creation form. On the left, under 'Event duration', there's a checkbox for 'All Day'. Below it, there are fields for 'Start date' (03.06.2022), 'Time' (10:00), 'End date' (03.06.2022), and 'Time' (18:00). There's also a 'Timezone' dropdown menu set to 'Europe/Warsaw'. On the right, under 'Direct link to join', there's a text input field with 'www.example.com'. Below that, under 'Short description for calendar', there's a text input field with 'Description for calendar'. At the bottom, under 'Location', there's a text input field with 'Online or fill out the venue'.

Schedule your Post

You asked - we did it! Now you can schedule your post to be published at a specific time.

To schedule your post for later, you just need to click the down arrow near the Publish button and choose Schedule post.

Code Formatting

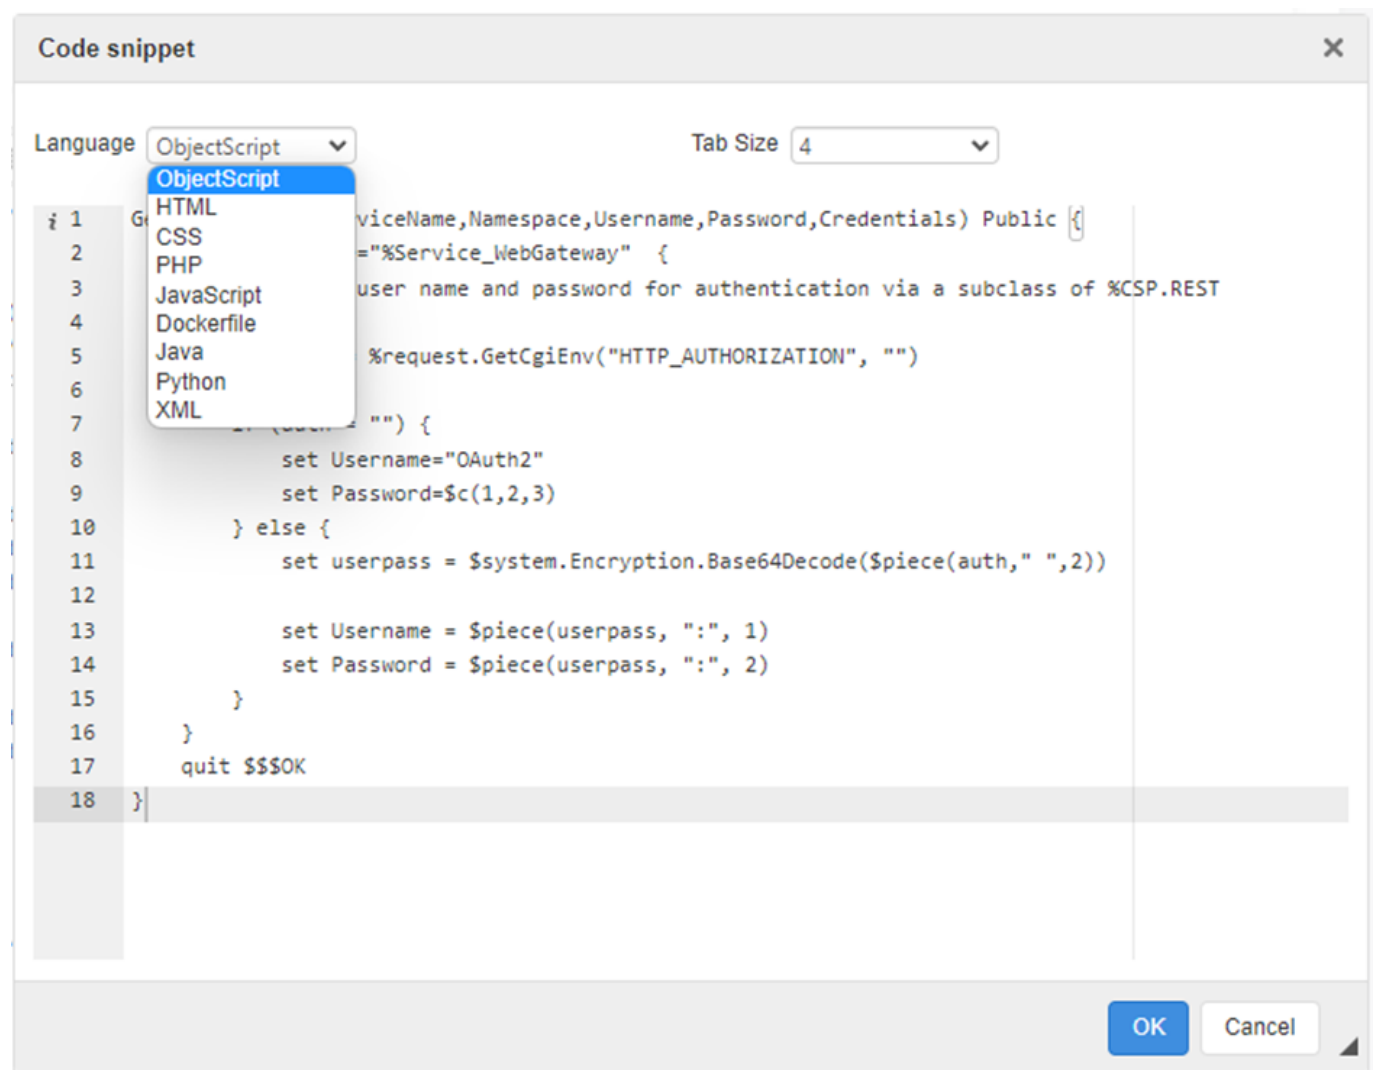

To share your code with others, we've added a built-in editor when inserting code.

Body*

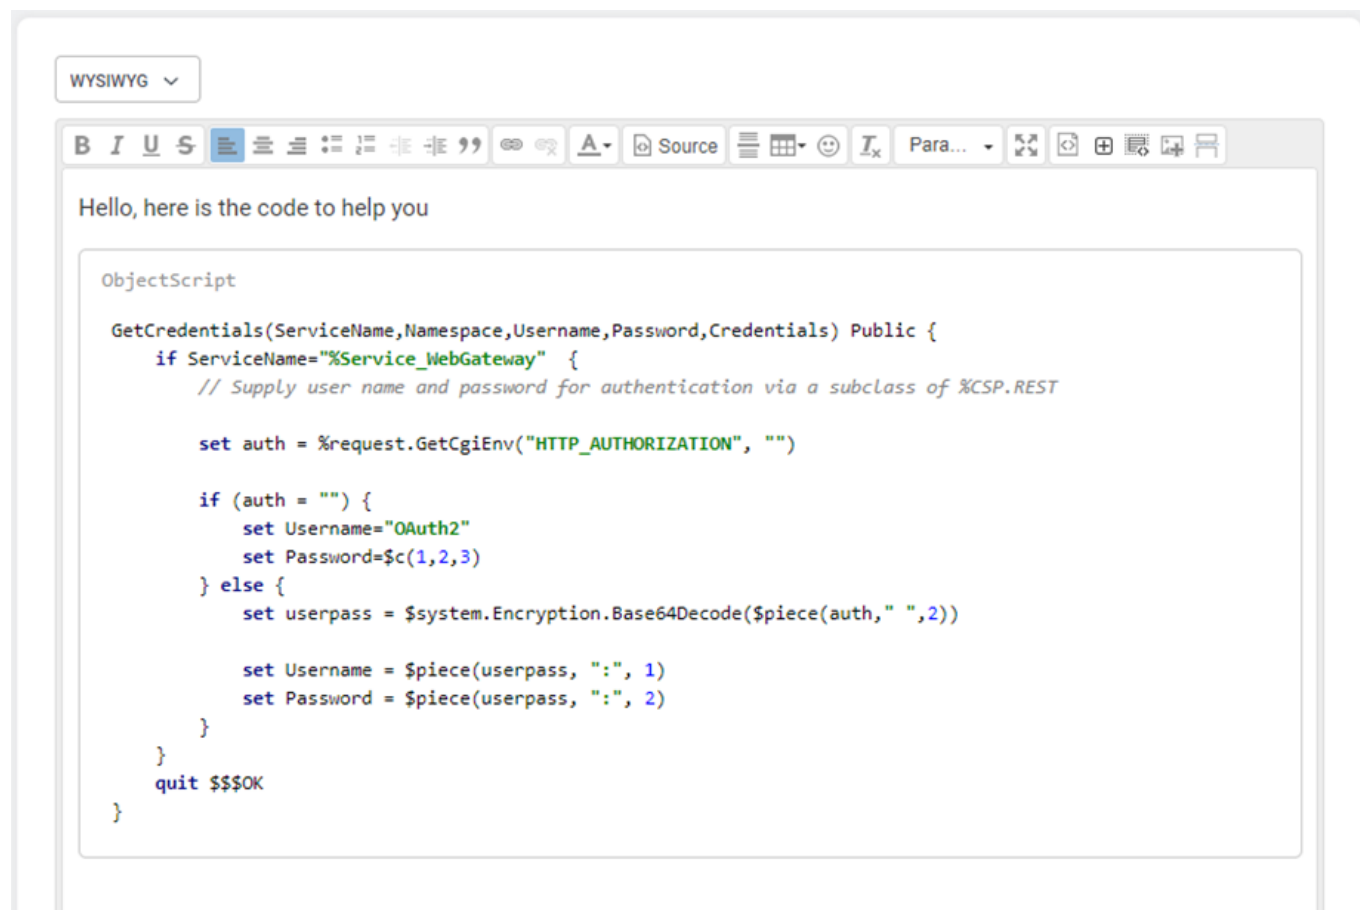

WYSIWYG

In it, you can select the appropriate programming language and tab size.

Besides, syntax highlighting occurs immediately when writing the text and the programming language is displayed in the upper left corner.

As a result, in your post, you will get beautifully formatted code in the desired programming language.

Evgeniy Potapov · 0 sec ago

Hello, here is the code to help you

ObjectScript

```

GetCredentials(ServiceName,Namespace,Username,Password,Credentials) Public {
    if ServiceName="%Service_WebGateway" {
        // Supply user name and password for authentication via a subclass of %CSP.REST

        set auth = %request.GetCgiEnv("HTTP_AUTHORIZATION", "")

        if (auth = "") {
            set Username="OAuth2"
            set Password=$c(1,2,3)
        } else {
            set userpass = $system.Encryption.Base64Decode($piece(auth," ",2))

            set Username = $piece(userpass, ":", 1)
            set Password = $piece(userpass, ":", 2)
        }
    }
    quit $$$OK
}

```

Table Creation

To simplify the formatting when creating a table, we added a function to quickly create a table by selecting the required number of cells.

The screenshot shows a rich text editor interface. At the top is a toolbar with various formatting icons. Below the toolbar is a large text area. In the center of the text area, a table creation tool is displayed. It consists of a 5x5 grid of cells. Above the grid is the text '5 x 5 Table'. Below the grid is a button labeled 'More'. The status bar at the bottom of the editor shows 'body p' and 'words: 0 | characters: 0'.

If you click on the button More at the bottom, opens the standard functionality for creating a table.

Replies and subscriptions

To see all info about the discussion at a glance, we added the number of replies at the top of the editor and the icon to subscribe to a discussion for post discussion [new replies].

Design of the Post Teaser

To make the bottom of the post look more balanced, we rearranged and changed the icons a bit.

Enjoy our updates!

Submit your requests for improvements and bug reports on [DC GitHub](#). Or post your suggestions in the comments to this post.

See you next time with even more cool changes!
