## Do messages created within objectscript processes get picked up by production purges.

Hi all.

I have a transform that I am calling from within an objectscript process, and I need to pass it a few values. I have in the past done this using the aux property, however I have got away with only needing to pass in a single value, so I have not had to worry about passing in anything other than a string container.

My initial thoughts were to create a custom message class with the properties I require and then pass this in as the aux value to the Transform, however I'm really unsure if this message class would then get picked up by my productions purges and I'd like to avoid filling up my environment with millions of messages I'm using to just pass 5-6 values to a transform.

Is it as simple as extending Ens.Request, or do I need to add an OnDelete Method? If the latter, any examples of how these are written are much appreciated.
