# Accessing Property within a Property

Hey Community,

I have an scenario, please advise or suggest possible ways to solve it.
So i have a persistent class to test results of a diagnostic laboratory. The properties are

- Patient name
- Type of Test
- Order ID

Type of test will values for Sugar, Urine and Thyroid. But for Thyroid which is a Profile test, should hold multiple properties like Tsh, T4, T5.
How can i design my class to be able to fetch all results in query by passing order id(proably using where clause)

#Data Model #SQL #Caché
