HELP DOUBTS MSM-MUMPS-UNIX

Hi, can anyone tell me how I should do the parameter calculation below in the MSM / MUMPS of InterSystems?

STAP SIZE

STACK SIZE

MAX MODIFIED BUFFERS

DISK I / O RATE

SLICE COMMANDS

PARTITION SIZE

BUFFER POOL SIZE

NUMBER OF MUSERVER PROCESSES We have a rolling MSM that suffers from hangovers from the Activate service and the Workstation service several times a day and we are unable to determine if those hangouts are related to the number of users or overloading the system. There are times when MSM / UNIX freezes and we lose any interaction with MSM, we have to perform a kill directly on the service to start again.
